Compression stockings are designed to provide pressure to the legs to help improve circulation and drainage; the pressure is created by weaving elastane into the construction of the stockings.

The unique construction of the weave in **FITLEGS[®] 2** allows us to vastly reduce the amount of elastane whilst still providing the amount of compression required.

This means that **FITLEGS[®] 2** are softer in use, making them more **comfortable to wear**, especially over long periods of time.

DUOFIT[™] Technology

FITLEGS[®] 2 feature our proprietary **DUOFIT[™]** technology which provides four-way stretch in the material delivering the following benefits:

- Easier application due to less elastane
- Single ankle measurement reducing nursing time when measuring patients
- Available in below knee, thigh length and tights

FITLEGS[®] 2 provide a graduated compression level of 23-32mmHg improving circulation and lymphatic drainage.
